FOR IMMEDIATE RELEASE

Cleveland, OH, - Grafix Plastics unveils its new line of OptiGrafix™ Optical Polymer Film Products. Enable, enhance or protect critical coherent optical applications with OptiGrafix™ films. OptiGrafix films feature very uniform distribution of birefringence, exceptional light transmission, outstanding clarity, and excellent dimensional stability. Best of all, OptiGrafix films are commercially available and are more economical than TAC, Cast Polycarbonate, CAB, PVA and other optical films!

OptiGrafix is available in three different grades: **OC Grade** - base film with very low levels of birefringence, **CF Grade** - film with fractional quarter wave values of birefringence, and **QW Grade** - quarter wave retardation film. CF Grade and QW Grade films make great retarders for use in LCD applications. The combination of optical properties, product availability, and economical price point make OptiGrafix™ Films the natural choice for critical, optical applications involving polarized or coherent light. With OptiGrafix™, *We Help You See The Light!*
